# Diversity

Microbial species in a sample

- **species richness:** total number of species
- **species abundance:** proportion of each species

Richness vs. Evenness

# Diversity

## Alpha diversity - Diversity within a given sample

- Chao 1 is a non-parametric estimator of the number of species in a community.
- Shannon index<sup>1</sup>

$$H = - \sum_{i=1}^S p_i \cdot \log p_i$$

Where:

$p_i$  = fraction of the entire population made up of species  $i$  (proportion of a species  $i$  relative to total number of species present)

$S$  = numbers of species encountered

A high value of  $H$  would be a representative of a diverse and equally distributed community and lower values represent less diverse community. A value of 0 would represent a community with just one species.

1. Shannon's diversity index quantifies the uncertainty in predicting the species identity of an individual that is taken at random from the dataset

# Diversity

## Alpha diversity - Effect of latitude

# Diversity

## Beta diversity - Compare diversity between samples

- Compute **distance** between samples:
  - **Bray-Curtis** dissimilarity: use abundance information
    - Varies between 0 and 1:
    - 0 means the two samples have the same composition
    - 1 means the two samples do not share any species

$$BC_{jk} = 1 - \frac{2 \sum_{i=1}^p \min(N_{ij}, N_{ik})}{\sum_{i=1}^p (N_{ij} + N_{ik})}$$

where  $N_{ij}$  is the abundance of species  $i$  in sample  $j$  and  $p$  the total number of species

- **Jaccard similarity** index
  - Number of common species between samples divided by total number of species in the two samples  $J(A, B) = \frac{|A \cap B|}{|A \cup B|}$
- **Ordinate** the samples
  - **NMDS**: Non-Metric Multidimensional Scaling

# Diversity

## Beta diversity - Effect of depth on Stramenopiles communities

# Environmental conditions

In oceanic waters:

- temperature
- salinity
- light
- nutrients

... which depend on:

- substrate (water vs.ice)
- latitude
- depth
- oceanic currents
- proximity of coast

# MetaPR2 - Taxonomy

## Eight levels:

- Kingdom: Eukaryota
- Supergroup:  
Archaeplastida
- Division: Chlorophyta
- Class: Mamiellophyceae
- Order: Mamielliales
- Family: Bathycoccaceae
- Genus: *Bathycoccus*
- Species: *B. prasinos*

Diversity

# MetaPR2 - In practice

- Help
  - Read in detail
- Sample selection
  - Major datasets: OSD, Tara, Malaspina
  - By habitat: oceanic, coastal etc...
  - V4 vs V9
  - DNA vs. RNA
  - Ecosystems
  - Substrate: water, ice, soil...
  - Size fractions: total, pico...
  - Depth level: surface, euphotic...
  - Minimum ASV: will filter out rare ASVs (e.g. 1000)
  - Selection can be saved (yaml file)
- Sample table
  - dataset\_name
  - paper
  - number of samples
  - number of ASVs
  - number of reads per sample (coverage)

# MetaPR2 - In practice

- **Taxonomy**

- Can select several taxa within one level
- Press validate every time you need to refresh
- Can exclude taxa to remove fungi, metazoa...
- Can save taxonomy and reload taxonomy (yaml file)

Select Taxa

Press VALIDATE after changing taxonomy to update screen.

Press RESET + VALIDATE to reset taxonomy to top level

**Supergroup**  
Archaeplastida

**Division**  
Chlorophyta

**Class**  
Mamiellophyceae

**Order**  
Mamiellales

**Family**  
Mamiellaceae

**Genus**  
All
